Beyond that point, the ordinate y becomes negative and increases indefinitely: not so the abscissa; r , which has a limit, that it does not pass; whence we may conclude that the descending branch of the curve has a vertical asymptote. For, when p is negative, we have $P = p t / (l + ps) + \log. -p + V(+ pfi)$. therefore $P = -p V(+ p^2) - \log. p + 1/(12)$. And if p , besides being negative, be very great, we may assume $1/(1 + p) = p$, and the logarithm may be neglected; because the logarithm is inconsiderable when compared with the number itself. When, therefore, p is negative and very great, $P = -p^3$; and since the constant quantity C may also then be neglected, in comparison with p , we shall have--and...
